

Tips on how to film yourself on a phone.

Clean your camera lens.

Give the glass of the phone camera a wipe before you start.

Make sure it has not got any marks on it.

You could use something like a clean t-shirt, or even a glasses cleaning cloth if you have one.

Do not use soap and water.

This is the difference cleaning your camera lens can make.

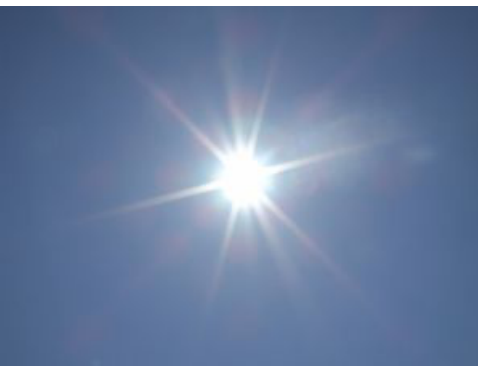

Holding your camera.

Have the camera on its side. Like in this picture.

This will make the film look more professional.

If you need some help you could ask someone to film you.

Lighting.

If you are outside make sure you are in the sun and have light on your face.

If you are inside sit with your face towards a window. The light from the window will light up your face.

It is best not to sit with your back to any windows.

Position of the camera.

You want to get your head and some of your shoulders in the picture.

Try and hold the camera at the same height as your eye.

If someone else is filming you make sure they get as much of you in the shot as possible.
